

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

1. (currently amended): An electromagnetic device mounted to an automotive transmission and used in an oil containing sulfur, said electromagnetic device comprising:
  - an outer casing;
  - a moveable shaft supported by said casing;
  - a bobbin disposed inside said outer casing so as to be disposed around said moveable shaft on a common axis with said moveable shaft;
  - a coil embedded in an outer molding, said coil being constructed by winding a conducting wire onto said bobbin,
  - an electrically-insulating layer coated on said conducting wire; and
  - means for preventing sulfur compounds from permeating said electrically-insulating layer and attendantly reducing the formation of sulfur compounds on a surface of said conducting wire, thereby suppressing the reduction in adhesive of the electrically-insulating layer to said conducting wire, wire breakage, and short circuiting between said conducting wires,
  - said preventing means comprising said electrically-insulating layer being of a material resistant to permeation by sulfur compounds.
2. (previously presented): The electromotive device according to Claim 1, wherein said bobbin and said outer molding are composed of a thermosetting resin.

3. (currently amended): An electromotive device mounted to an automotive transmission and used in an oil containing sulfur, said electromagnetic device comprising:

an outer casing;

a moveable shaft supported by said outer casing;

a bobbin disposed inside said outer casing so as to be disposed around said moveable shaft on a common axis with said moveable shaft;

a coil embedded in an outer molding, said coil being constructed by winding a conducting wire onto said bobbin, and

an electrically-insulating layer coated on said conducting wire;

wherein said electrically-insulating layer comprises a modified polyimide resin which is resistant to permeation by sulfur compounds and organosulfur compounds, said electrically-insulating layer ~~for~~ preventing sulfur compounds and organosulfur compounds from permeating said electrically-insulating layer and attendantly reducing the formation of sulfur compounds on a surface of said conducting wire, thereby suppressing the reduction in adhesive of the electrically-insulating layer to said conducting wire, wire breakage, and short circuiting between said conducting wires.

4. (previously presented): The electromotive device according to Claim 3, wherein said bobbin and said outer molding are composed of a thermosetting resin.

5. (currently amended): An electromotive device mounted to an automotive transmission and used in an oil containing sulfur, said electromagnetic device comprising:

an outer casing;

a moveable shaft supported by said outer casing;

a bobbin disposed inside said outer casing so as to be disposed around said moveable shaft on a common axis with said moveable shaft;

a coil embedded in an outer molding, said coil being constructed by winding a conducting wire onto said bobbin, and

an electrically-insulating layer coated on said conducting wire;

wherein said electrically-insulating layer comprises a thermosetting epoxy resin which is resistant to permeation by sulfur compounds and organosulfur compounds, said electrically-insulating layer ~~for~~ preventing sulfur compounds and organosulfur compounds from permeating said electrically-insulating layer and attendantly reducing the formation of sulfur compounds on a surface of said conducting wire, thereby suppressing the reduction in adhesive of the electrically-insulating layer to said conducting wire, wire breakage, and short circuiting between said conducting wires.

6. (previously presented): The electromotive device according to Claim 5, wherein said bobbin and said outer molding are composed of a thermosetting resin.

7. (currently amended): An electromotive device mounted to an automotive transmission and used in an oil containing sulfur, said electromagnetic device comprising:
- an outer casing;
  - a moveable shaft supported by said outer casing;
  - a bobbin disposed inside said outer casing so as to be disposed around said moveable shaft on a common axis with said moveable shaft;
  - a coil embedded in an outer molding, said coil being constructed by winding a conducting wire onto said bobbin, and
  - an electrically-insulating layer coated on said conducting wire;
- wherein said electrically-insulating layer comprises a phenol resin which is resistant to permeation by sulfur compounds and organosulfur compounds, said electrically-insulating layer ~~for~~ preventing sulfur compounds and organosulfur compounds from permeating said electrically-insulating layer and attendantly reducing the formation of sulfur compounds on a surface of said conducting wire, thereby suppressing the reduction in adhesive of the electrically-insulating layer to said conducting wire, wire breakage, and short circuiting between said conducting wires.
8. (previously presented): The electromotive device according to Claim 7, wherein said bobbin and said outer molding are composed of a thermosetting resin.
